Project : Credit Card Fraud Detection

In this notebook I will try to predict fraud transactions from a given data set. Given that the data is imbalanced, standard metrics for evaluating classification algorithm (such as accuracy) are invalid. I will focus on the following metrics: Sensitivity (true positive rate) and Specificity (true negative rate). Of course, they are dependent on each other, so we want to find optimal trade-off between them. Such trade-off usually depends on the application of the algorithm, and in case of fraud detection I would prefer to see high sensitivity (e.g. given that a transaction is fraud, I want to be able to detect it with high probability).

IMPORTING LIBRARIES:

```
import numpy as np
import pandas as pd
import matplotlib.pyplot as plt
import seaborn as sns
from pylab import rcParams
import warnings
warnings.filterwarnings('ignore')
```

+ Code + Text

READING DATASET :

```
data=pd.read_csv('/kaggle/creditcardfraud/creditcard.csv')
```

```
data.head()
```

	Time	V1	V2	V3	V4	V5	V6	V7	V8	V9	...
0	0.0	-1.359807	-0.072781	2.536347	1.378155	-0.338321	0.462388	0.239599	0.098698	0.363787

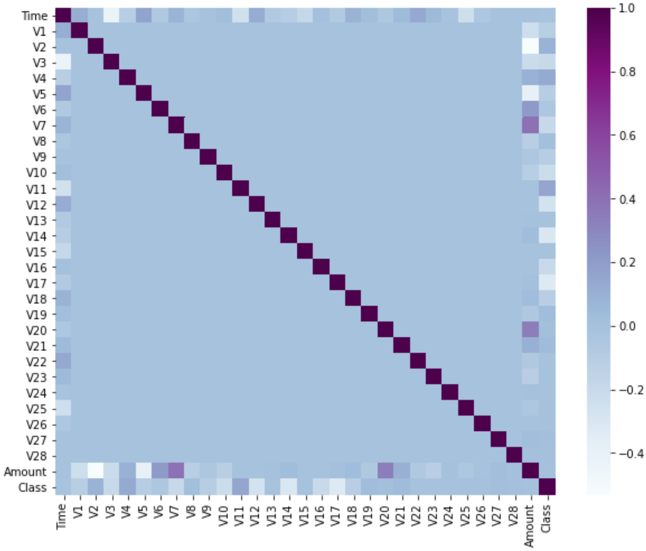
sns.heatmap(corr,cmap='BuPu')
```

```
<matplotlib.axes._subplots.AxesSubplot at 0x7f4c890f89b0>
```



Let us build our models:

```
from sklearn.model_selection import train_test_split
```

Model 1:

```
X=data.drop(['Class'],axis=1)
```

```
y=data['Class']
```

```
X_train,X_test,y_train,y_test=train_test_split(X,y,test_size=0.30,random_state=123)
```

```
from sklearn.ensemble import RandomForestClassifier
```

```
rfc=RandomForestClassifier()
```

```
model=rfc.fit(X_train,y_train)
```

```
prediction=model.predict(X_test)
```

```
from sklearn.metrics import accuracy_score
```

```
accuracy_score(y_test,prediction)
```

```
0.9995786664794073
```

Model 2:

```
from sklearn.linear_model import LogisticRegression
```

```
X1=data.drop(['Class'],axis=1)
```

```
y1=data['Class']
```

```
X1_train,X1_test,y1_train,y1_test=train_test_split(X1,y1,test_size=0.3,random_state=123)
```

```
lr=LogisticRegression()
```

```
model2=lr.fit(X1_train,y1_train)
```

```
prediction2=model2.predict(X1_test)
```

```
accuracy_score(y1_test,prediction2)
```

```
0.9988764439450862
```

Model 3:

```
from sklearn.tree import DecisionTreeRegressor
```

```
X2=data.drop(['Class'],axis=1)
```

```
y2=data['Class']
```

```
dt=DecisionTreeRegressor()
```

```
X2_train,X2_test,y2_train,y2_test=train_test_split(X2,y2,test_size=0.3,random_state=123)
```

```
model3=dt.fit(X2_train,y2_train)
```

```
prediction3=model3.predict(X2_test)
```

```
accuracy_score(y2_test,prediction3)
```

```
0.999133925541004
```

All of our models performed with a very high accuracy.
